1 Pandas for Data Science

This tutorial covers enough content to get started with Python Pandas library. This library contains functionalities that can be extremely useful for data analysis. Let's dive into this topic.

This tutorial is organized as follows: A sequence of tasks is presented, followed by the presentation of the code segment completes that task using the Pandas library. For data analysis, a simple dataset of Pokemon is considered that can be found using the link: https://www.kaggle.com/abcsds/pokemon/downloads/pokemon.zip/2.

1.1 Task 1:

Import the Pandas library, read the downloaded CSV file from the website as mentioned earlier, and then display the first ten rows of the dataset.

[2]:
```
import pandas as pd
poke_data = pd.read_csv('Pokemon.csv')
poke_data.head(10)
```

[2]:

	#	Name	Type 1	Type 2	Total	HP	Attack	Defense	\
0	1	Bulbasaur	Grass	Poison	318	45	49	49	
1	2	Ivysaur	Grass	Poison	405	60	62	63	
2	3	Venusaur	Grass	Poison	525	80	82	83	
3	3	VenusaurMega Venusaur	Grass	Poison	625	80	100	123	
4	4	Charmander	Fire	NaN	309	39	52	43	
5	5	Charmeleon	Fire	NaN	405	58	64	58	
6	6	Charizard	Fire	Flying	534	78	84	78	
7	6	CharizardMega Charizard X	Fire	Dragon	634	78	130	111	
8	6	CharizardMega Charizard Y	Fire	Flying	634	78	104	78	
9	7	Squirtle	Water	NaN	314	44	48	65	

	Sp. Atk	Sp. Def	Speed	Generation	Legendary
0	65	65	45	1	False
1	80	80	60	1	False
2	100	100	80	1	False
3	122	120	80	1	False
4	60	50	65	1	False
5	80	65	80	1	False
6	109	85	100	1	False

```
7      130       85    100           1      False
8      159      115    100           1      False
9       50       64     43           1      False
```

1.2 Task 2:

Display the column names separately and then count the number of columns/features/attributes in the dataset. Display the number of rows/samples in the dataset as well as show a high-level description of the dataset.

[81]:
```
import numpy as np
print("The name of the columns are as follows: ")
for val in poke_data.columns.values:
    print(val)
print("The number of columns is: ", len(poke_data.columns.values))
print("The number of samples is: ", np.shape(poke_data.values)[0])
poke_data.describe()
```

```
The name of the columns are as follows:
#
Name
Type 1
Type 2
Total
HP
Attack
Defense
Sp. Atk
Sp. Def
Speed
Generation
Legendary
The number of columns is:  13
The number of samples is:  800
```

[81]:

	#	Total	HP	Attack	Defense	Sp. Atk	\
count	800.000000	800.00000	800.000000	800.000000	800.000000	800.000000

```

1.3 Task 3

Display the last ten observations from the dataset. Only show the name of the Pokemon in the first case. In the second case, show separately the following columns: Name, Attack, and Speed.

[93]:
```
print(poke_data['Name'].tail(10))
poke_data[['Name', 'Attack', 'Speed']].tail(10)
```

```
790                 Noibat
791                Noivern
792                Xerneas
793                Yveltal
794       Zygarde50% Forme

799	Volcanion	110	70

1.4 Task 4:

Display rows from 15 to 20. Show the names of the Pokemons. Show the following columns: Name, Type 1, Type 2. Show rows from hp to legendary.

[101]:
```
print(poke_data.loc[15:20, 'Name'])
print(poke_data.loc[15:20, ['Name', 'Type 1', 'Type 2']])
print(poke_data.loc[15:20, 'HP': 'Legendary'])
```

```
15               Butterfree
16                   Weedle
17                   Kakuna
18                 Beedrill
19    BeedrillMega Beedrill
20                   Pidgey
Name: Name, dtype: object
                     Name  Type 1  Type 2
15             Butterfree     Bug  Flying
16                 Weedle     Bug  Poison

    HP  Attack  Defense  Sp. Atk  Sp. Def  Speed  Generation  Legendary
15  60      45       50       90       80     70           1      False
16  40      35       30       20       20     50           1      False
17  45      25       50       25       25     35           1      False
18  65      90       40       45       80     75           1      False
19  65     150       40       15       80    145           1      False
20  40      45       40       35       35     56           1      False
```

1.5 Task 5:

Complete the previous task using iloc function.

[106]:
```
print(poke_data.iloc[15:20, 1])
print(poke_data.iloc[15:20, [1, 2, 3]])
print(poke_data.iloc[15:20, 5:12])
```

```
15               Butterfree
16                   Weedle
17                   Kakuna

                     Name Type 1  Type 2
15             Butterfree    Bug  Flying
16                 Weedle    Bug  Poison
17                 Kakuna    Bug  Poison
18               Beedrill    Bug  Poison
19  BeedrillMega Beedrill    Bug  Poison
    HP  Attack  Defense  Sp. Atk  Sp. Def  Speed  Generation
15  60      45       50       90       80     70           1
16  40      35       30       20       20     50           1
17  45      25       50       25       25     35           1
18  65      90       40       45       80     75           1
19  65     150       40       15       80    145           1
```

1.6 Task 6:

Create a new data frame using the first 5 attributes and the last 10 samples. Display the new data frame. Show the data frame seperately after resetting the index.

[110]:
```
new_poke = poke_data.iloc[-10:, 0:5]
print(new_poke)
new_poke = new_poke.reset_index()
print(new_poke)
```

```
       #                 Name   Type 1  Type 2  Total
790  714               Noibat   Flying  Dragon    245

9    799  721            Volcanion     Fire   Water    600
```

1.7 Task 7:

Iterate through the samples of the dataset and display the hp and attack power of the first two dark dragon Pokemon.

[119]:
```
# Method 1
count = 1
for index, row in poke_data.iterrows():
    if row['Type 1'] == "Dark" and row['Type 2'] == "Dragon" and count <= 2:
        print(index, row['Name'], row['HP'], row['Attack'], row['Type 1'],␣
 ↪row['Type 2'])
        count += 1

#Method 2
poke_data.loc[(poke_data['Type 1'] == "Dark") & (poke_data['Type 2'] ==␣
 ↪"Dragon")].head(2)
```

```
694 Deino 52 65 Dark Dragon
695 Zweilous 72 85 Dark Dragon
```

[119]:

	#	Name	Type 1	Type 2	Total	HP	Attack	Defense	Sp. Atk	Sp. Def	Speed	Generation	Legendary
694	633	Deino	Dark	Dragon	300	52	65	50	45	50	38	5	False
695	634	Zweilous	Dark	Dragon	420	72	85	70	65	70	58	5	False

1.8 Task 8:

Sort the Pokemons based on their Type 1 category in descending order. When there are conflicts, sort the values based on their Type 2 attribute in ascending order. Show only the first 20 rows.

[123]:
```
poke_data.sort_values(['Type 1', 'Type 2'], ascending=[False, True]).head(20)
```

[123]:

508       60      120      50           4      False
```

1.9 Task 9:

What is the HP of the Pokemon named 'Butterfree'? Is the 240th Pokemon legendary?

[134]:
```
print("The HP of the Pokemon named 'Butterfree' is: ", poke_data.
 ↪loc[poke_data['Name'] == "Butterfree"]['HP'].values[0])
if poke_data.iloc[240, -1]:
    print("The 240th Pokemon is", "legendary")
else:
    print("The 240th Pokemon is", "not Legendary")
```

```
The HP of the Pokemon named 'Butterfree' is:  60
The 240th Pokemon is not Legendary
```

1.10 Task 10:

Create a new column called 'Power'. The column assigns the average attack and defense of the corresponding pokemon. Drop the newly created column and display the dataset again. Show only the first five rows.

[136]:
```
poke_data['Power'] = (poke_data['Attack'] + poke_data['Defense']) / 2
print(poke_data.head(5))
poke_data = poke_data.drop(columns=['Power'])
print(poke_data.head(5))
```

```
   #                   Name Type 1  Type 2  Total  HP  Attack  Defense  \
0  1              Bulbasaur  Grass  Poison    318  45      49       49

1.11 Task 11:

Create a new column called 'Average Power' that computes the average score of all the attributes from hp to speed. Show the names and average powers of the first 5 rows. Save the modified data into two files using two seperators: comma and tab. Avoid writing the index into the newly created files. In the end, drop the column for further processing.

[148]:
```
print('Method 1')
poke_data['Average Power'] = poke_data.iloc[:, [5, 6, 7, 8, 9, 10]].sum(axis=1)␣
 ↪/ 6
print(poke_data[['Name', 'Average Power']].head(5))
print('Method 2')
poke_data['Average Power'] = poke_data.iloc[:, 5:11].sum(axis=1) / 6
print(poke_data[['Name', 'Average Power']].head(5))
print('Method 3')
poke_data['Average Power'] = poke_data.loc[:, 'HP':'Speed'].sum(axis=1) / 6
print(poke_data[['Name', 'Average Power']].head(5))

poke_data.to_csv('modified_comma', index=False)
poke_data.to_csv('modified_tab', index=False, sep='\t')
poke_data = poke_data.drop(columns=['Average Power'])
print(poke_data.head(5))
```

```
Method 1
